

COMPARATIVE STUDY OF TRADITIONAL AND LOW CODE DEVELOPMENT

EXPERIMENT – 1

NAME : SONIYA D

ROLL NO: 240701522

1. Aim

To study and compare **Traditional Development** and **Low-Code Development** based on their development process, coding effort, development time, cost, and ease of use.

2. Introduction to Traditional Development

Traditional development is the process of building software by writing code manually using programming languages such as Java, Python, C#, or JavaScript. Developers have complete control over the application's design, functionality, and performance.

Key Features

- Requires extensive coding.
- Needs skilled programmers.
- Suitable for large and complex applications.
- Provides high flexibility and customization.
- Development takes more time.

Examples

- Banking Systems
- E-commerce Platforms
- Hospital Management Systems

3. Introduction to Low-Code Development

Low-code development is a software development approach that allows applications to be created using visual tools, drag-and-drop components, and pre-built templates with minimal coding.

Key Features

- Requires little coding.
- Faster application development.
- Easy to learn and use.
- Reduces development cost and effort.
- Suitable for simple to medium-complexity applications.

Examples

- Microsoft Power Apps
- OutSystems
- Mendix
- Zoho Creator

4. Stages in Traditional Development

Explanation

1. Gather user requirements.
2. Analyze system needs.
3. Design the software structure.
4. Write the program code.
5. Test for errors.
6. Deploy the application.
7. Maintain and update the system.

5. STAGES IN LOW-CODE DEVELOPMENT

Comparison Between Traditional Development and Low-Code Development

No.	Traditional Development	Low-Code Development
1	Requires extensive manual coding.	Requires minimal coding with visual tools.
2	Needs skilled software developers.	Can be used by both developers and non-developers.
3	Development takes more time.	Development is faster.
4	Development cost is higher.	Development cost is lower.
5	Suitable for complex and large-scale applications.	Suitable for simple and medium-scale applications.
6	Provides high flexibility and customization.	Customization is limited by platform features.
7	Testing and debugging are mostly manual.	Many testing and debugging tasks are automated.
8	Maintenance requires more coding effort.	Maintenance is easier and quicker.
9	Changes and updates require code modification.	Changes can be made through visual configuration.

Result:

The study shows that Traditional Development requires more coding, time, and cost, while Low-Code Development is faster, easier, and needs less coding. Both methods are useful, and the choice depends on the project requirements.
